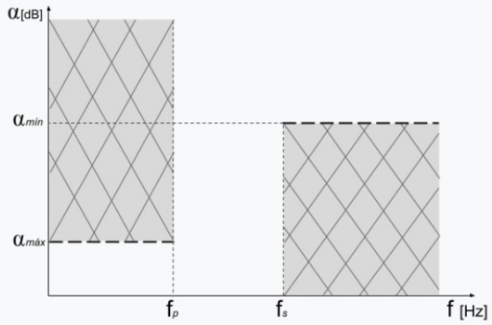
A partir de la siguiente plantilla, sabiendo que:



αmáx [dB]	αmín [dB]	fp [Hz]	fs [Hz]
1	12	1500	3000

1. Obtener la transferencia para máxima planicidad en la banda de paso **utilizando los conceptos de partes de función**. Recordar que: $|T(j\omega)|^2 = T(j\omega)\cdot T(-j\omega) = T(s)\cdot T(-s)|_{s=j\omega}$
2. Obtener el diagrama de polos y ceros, y un bosquejo de la respuesta en frecuencia.
3. Implementar el circuito **normalizado** con estructuras pasivas separadas mediante buffers.
4. Obtenga el circuito que cumpla con la plantilla requerida si dispone de capacitores de 100nf.
5. Proponga una red que se comporte igual a la hallada en **4)** pero con resistores, capacitores y opamps.

Bonus:

- +10 💎 Proponer un planteo alternativo a **1)** usando la ω_{Butter} (**ver Schaumann 6.4**)
- +10 ⚽ Simulación **numérica y circuital.**
- +10 🍺 Presentación en jupyter notebook.

Func atenuación α:

$$\alpha^2 = 1 + \varepsilon^2 \omega^{2n} \longrightarrow \alpha = (1+\varepsilon^2\omega^{2n})^{1/2}$$

Expresada en dB: $\alpha_{dB} = 10\log(1+\varepsilon^2\omega^{2n})$

En $\omega = \omega_{p_n} = 1$: $\alpha_{dB}\Big|_{\omega=1} = \alpha_{max_{dB}} = 10\log(1+\varepsilon^2)$

$$\hookrightarrow \varepsilon^2 = 10^{\frac{\alpha_{max\,dB}}{10}} - 1 \quad (1)$$

En $\omega = \omega_{s_n}$: $\alpha_{dB}\Big|_{\omega=\omega_s} = \alpha_{min\,dB} = 10\log(1+\varepsilon^2\omega_{s_n}^{2n}) \quad (2)$

Reemplazando en (1): $\varepsilon^2 = 10^{\frac{\alpha_{max\,dB}}{10}} - 1 \longrightarrow \varepsilon^2 = 0{,}2589$

Reemplazando en (2) e iterando:

- $n=3$: $10\log(1+\varepsilon^2\omega_{s_n}^{2n}) = 12{,}4476 > \alpha_{min_{dB}} = 12 \longleftarrow$ cumple
